Section 1: Introduction
MorphoAccess® J Series terminal

Congratulations for choosing a MorphoAccess® J Series Automatic Fingerprint Recognition Terminal.

MorphoAccess® J Series terminals provides an innovative and effective solution for access control applications using Fingerprint Verification or/and Identification.

Among a range of alternative biometric technologies, the use of finger imaging has significant advantages: each finger constitutes an unalterable physical signature, developed before birth and preserved until death. Unlike DNA, a finger image is unique for each individual - even identical twins.

The MorphoAccess® J Series terminals integrate Morpho image processing and feature matching algorithms. This technology is based on lessons learned during 25 years of experience in the field of biometric identification and the creation of literally millions of individual fingerprint identification records.

Designed for physical access control applications, MorphoAccess® J Series terminals feature a compact, attractive design, coupled with high reliability and security. These latest-generation terminals are both robust and easy to use for a variety of applications, including office, headquarters and administrative building security, as well as protection of external access points.

To ensure the most effective use of your MorphoAccess® J Series terminal, we recommend that you read this User Guide completely.
# Scope of the document

This guide deals with the use of the MorphoAccess® J Series terminals, which is made up of following list of products.

Safety instructions

The installation of this product should be made by a qualified service Person and should comply with all local regulations.

It is strongly recommended to use a class II power supply at 12V ±5% and 0.5A, min (1A with Wi-Fi™ option) according with Safety Electrical Low Voltage (SELV). The 12V power supply cable length should not exceed 3 meters.

This product is intended to be installed with a power supply complying with EN60950, in accordance with the NEC Class 2 requirements; or supplied by a listed EN60950 external Power Unit marked Class 2, Limited Power source, or LPS and rated 12VDC, 0.5A minimum (1A with Wi-Fi™ option).

In case of building-to-building connection it is recommended to connect 0V to ground. Ground cable must be connected with the terminal block 0V GND.

Note that all connections of the MorphoAccess® J Series terminal described hereafter are of SELV (Safety Electrical Low Voltage) type.

Europe information

Morpho hereby declares that the MorphoAccess® J Series terminal has been tested and found compliant with following listed standards: EN302 2912 V.1.1.1 (2005-07) + recommendation 1999/519/CE with standard EN 50364; EN 301 489-3 V.1.4.1 (02), and low voltage Directive 2006/95/CE: CEI609501:2005 2nd edition.

USA information

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Responsible Party: Morpho, Le Ponant de Paris, 27, rue Leblanc F 75512 PARIS CEDEX 15 FRANCE.

NOTE This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

• reorient or relocate the receiving antenna,
• increase the separation between the equipment and receiver,
• connect the equipment into an outlet on a circuit different from that to which the receiver is connected,
• consult the dealer or an experienced radio/TV technician for help.
Shielded cables must be used with this unit to ensure compliance with the Class B FCC limits.
Section 2: MorphoAccess® J Series terminal presentation
Interfaces description

Introduction

Note that all connections of the MorphoAccess® J Series terminal described hereafter are of SELV (Safety Electrical Low Voltage) type.

User Interface (see figure 1)

![Image of MorphoAccess® J Series terminal](image)

Figure 1: MorphoAccess® J Series terminal front view

The MorphoAccess® J Series terminals offer a simple and ergonomic man-machine interface items dedicated to access control based on fingerprint recognition:

- (1) a high quality optical scanner to capture fingerprints,
- (2) a multi-color led,
- (3) a multi-toned buzzer,
- (4) an optional contactless smartcard reader (MIFARE™ and DESFire™).
Power supply interface (see figures 2)

The terminal can be powered by two different ways:

- Either by the two wires +12V DC/GND, see (11)
- Or by the Power Over Ethernet function, using TJ45 connector (9), or the 5-wires block (12)

**Power Over Ethernet**

The MorphoAccess® J Series terminal can be powered through the Ethernet interface using POE (Power Over Ethernet) feature.

- When the terminal is connected to the network by the RJ45 connector (9), it allows either the power supply over the Data pins or the power supply over the spare pins.
- When the terminal is connected to the network by the 5 wires block (12), only power supply over the data pins is possible

Please contact your network administrator to know which POE mode is provided by the network.

![MorphoAccess® J Series terminal rear view (connectors)](image-url)
Hardware reset button (see figure 3)

(14) A hardware reset button executes, when pressed, a power down/power up sequence. This reset button is located under the removable smoked front cover, at the left side of the status LED.

Administration interface (see figures 2 and 3)

The terminal provides several ports for its management:

- (9) A RJ45 Ethernet connector (LAN 10/100 Mbps, using TCP or SSL protocol)
- (12) A 5 wires Ethernet block (LAN 10/100 Mbps, using TCP or SSL protocol)
- (10) A USB host port dedicated a Wi-Fi™ USB adaptor
- (13) A USB host port dedicated to a USB mass storage key, to executes punctual and limited modifications. This USB port is located under the removable smoked front cover.

Figure 3: MorphoAccess® J Series terminal front view, without removable smoked glass
Access control systems interface (see figure 2)

The terminal provides several interfaces for an easy integration into a global access control system.

**Sending of a message at the end of local access control**

The terminal is able to send a message to a distant system when local checks are completed. This message can be used for a simple storage of all access requests, or to start more sophisticated processes such as additional access rights checks.

This feature is described in [Sending the access control result to a distant system](#) section.

For this feature the terminal can use:

- An Ethernet link: through the RJ45 connector (9) or 5-wires block (12), using UDP or TCP or SSL protocol
- A Wi-Fi™ link: by connecting a USB Wi-Fi™ adapter in the USB rear port (10), using the UDP or TCP or SSL protocol
- A serial port (5), using the Wiegand or DataClock or RS485 protocol

It is not allowed to use simultaneously the Ethernet link and the Wi-Fi™ link. But, it is allowed to use the serial port and either the Ethernet or the Wi-Fi™ link.

This feature is compatible with the management through the Ethernet or Wi-Fi™ link.

**Input signals and relay contacts**

The MorphoAccess® J Series terminal offers several interfaces:

- (6) Two LED IN inputs: one for “access granted” answer, and one for “access denied” answer. This feature is described in [LED IN feature](#) section.

- (7) A relay contact, to directly command a physical device such as a door lock. This feature is described in [Internal Relay activation on Access Granted result](#) section.

- (8) A relay contact which provides the status of the anti-tamper and anti-pulling switches. This feature is described in [Anti-tamper and anti-pulling switches](#) section.
USB ports usage

Plugging a USB Mass storage key

The front USB port of the MorphoAccess® terminal is dedicated to the connection of a USB Mass Storage key, to configure the terminal with command scripts. This feature is described in the “Setting up IP parameters with a USB Mass Storage Key” section, and in the documents listed below:

- MorphoAccess® USB Network Tool User Guide
- MorphoAccess® USB encoder User Guide

![Figure 4: MorphoAccess® J Series terminal front USB port with a USB mass storage key](image-url)
Plugging a USB Wi-Fi™ adapter

The rear USB port of the MorphoAccess® J Series terminal is dedicated to the connection of a Wi-Fi™ USB adapter.

Figure 5: MorphoAccess® J Series terminal rear USB port with a Wi-Fi™ adapter
Section 3: Connecting a MorphoAccess® to a PC
Introduction

Why connecting a MorphoAccess® terminal to a PC

The MorphoAccess® J Series terminal is designed to be able to run in standalone mode, it means without any connection to a master system. But sometimes, a connection with a PC is useful to perform tasks like:

- Terminal configuration
- Terminal maintenance: firmware upgrade, add a software license
- Database management: add or remove a user
- Log file management: get or delete log file
- Wi-Fi™ connection configuration

Connection methods

The MorphoAccess® terminal can be connected to a PC by an Ethernet cable, either directly or through a LAN. The LAN can be reduced to only one Ethernet router.

Once physically connected, the MorphoAccess® terminal can be configured using an application such as Morpho Bio Toolbox or MATM.

A POE (Power Over Ethernet) current injector is mandatory if the MorphoAccess® J Series terminal is not powered by the +12VDC/GND wires block.

Network parameter initialization

The network parameters of the MorphoAccess® terminal are:

<table>
<thead>
<tr>
<th>IP address assignation</th>
<th>Parameter</th>
<th>Factory value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static (default)</td>
<td>Terminal IP address</td>
<td>134.1.32.214</td>
</tr>
<tr>
<td></td>
<td>Gateway IP address</td>
<td>134.1.6.20</td>
</tr>
<tr>
<td></td>
<td>Sub network mask</td>
<td>255.255.240.0</td>
</tr>
<tr>
<td>Dynamic (DHCP)</td>
<td>Host name</td>
<td>MA&lt;Serial Number&gt;</td>
</tr>
</tbody>
</table>

If it is not possible to use default network parameter values, then these values must be modified. The easiest way to change network parameters is to use a USB Mass Storage key.

The procedure is described in the Setting up IP parameters with a USB Mass Storage Key section.
Point to Point Ethernet Connection

The MorphoAccess® terminal can be connected directly to a PC by an Ethernet cable. But there are some limits:

• if the PC Ethernet port doesn’t support the Auto-MDIX feature, then a crossover Ethernet cable is mandatory. If no crossover Ethernet cable is available, then a switch can be used (please refer to next section).

• If the PC to be used is already connected to a LAN, then it must be either disconnected from the LAN, or equipped with a 2nd network interface board, which will be dedicated to the connection with the terminal. It could be mandatory to modify the network parameter of the PC: please contact your LAN administrator to define the best solution.

Figure 6: Direct point to point Ethernet connection
Connection through only one Ethernet switch

The MorphoAccess® terminal can be connected to a PC through an Ethernet switch. This is useful when no crossover cable is available, but instead, one Ethernet switch and two Ethernet standard cables are available.

WARNING: an Ethernet HUB doesn’t allow a connection between two of its ports. An Ethernet switch is really mandatory.

Figure 7: Connection, through an Ethernet switch
Connection through a LAN

Description

The MorphoAccess® terminal can be connected to a PC through a Local Area Network (LAN).

The MorphoAccess® terminal required for a connection, is specified by its IP address or by its host name, if it can be added to the DNS Server database. The IP address is either static, or dynamically assigned by the DHCP server of the network.

![Figure 8: Connection through a LAN](image)

It is recommended to connect MorphoAccess® terminals on a dedicated network to reduce possible fraudulent accesses to terminal configuration. Please contact network administrator for more information about LAN security strategies.

Before connecting the terminal to a LAN (through Ethernet), it is necessary to specify the LAN parameters to the terminal. The values of these parameters are to be provided and/or approved by the administrator of the network.

LAN with DNS Server

When a DNS server is available in the LAN, the PC can request the connection to the MorphoAccess® terminal by using its host name instead of its IP address.

But the network administrator must add the MorphoAccess® terminal host name to the DNS server database. Otherwise, a TCP open session request, using the terminal’s hostname, will fail. Please contact local network administrator for this operation.

It is useful to specify the MorphoAccess® terminal by its host name, when the DHCP mode is enabled, as the IP address of the terminal can change after a power up.
LAN without DNS Server

This section is about LAN without DNS Server, or with DNS Server but the MorphoAccess® terminal host name cannot be added to the DNS Server base.

In that case the PC is not able to establish a connection with a MorphoAccess® terminal using its host name. The IP address of the MorphoAccess® terminal is the only way to specify the terminal.

It is not recommended to use the DHCP mode for normal operation, as the IP address of the terminal can change after each power-up.

Static IP address (DHCP is off)

This is the easiest way to connect a terminal to a LAN: the IP address of the terminal remains the same after each restart, and the Host System need only to know this IP address to establish a connection with the terminal.

The IP address of the terminal must be reserved in the router by the network administrator. Please contact the network administrator to require the value of the network parameters listed below:

- The MorphoAccess® terminal IP address (one per terminal),
- gateway IP address,
- local subnet mask value.

Warning: if the MorphoAccess® terminal uses an IP address already assigned in the network, the connection to the terminal will be instable.

Dynamic IP address (DHCP is on)

When the DHCP mode is activated in the terminal, at each power up the MorphoAccess® terminal required an IP address to the network router. It could be the same IP address as the one assigned before the power up, but it could also be different.

Please contact the network administrator to know if the LAN support DHCP mode.
Setting up IP parameters with a USB Mass Storage Key

The IP configuration parameters can be set by using a USB mass storage key. No wired connection with a PC is required. This operation requires a standard USB Mass Storage key (FAT16 formatted and 1 Gbyte maximum), and a dedicated PC application: USB Network Configuration Tool.

This procedure is useful for MorphoAccess® terminals without keyboard and screen, but is applicable also to MorphoAccess® terminals with keyboard and screen.

The procedure is detailed in the sections below, and in the MorphoAccess® USB Network Tool User Guide document.

First step: build a configuration file on USB Mass Storage Key

Run the USB Network Configuration Tool application on a PC: an interface window such as the one below is opened by the application.

![USB Network Configuration Tool main window](image)
Then insert the USB mass storage key into a free USB port of the PC. First select either DHCP mode (IP address allocated dynamically), or static mode (static IP address).

- If the DHCP mode is selected, please specify terminal Host name in accordance with network administrator
- If the DHCP mode is not selected, please specify terminal IP parameters (terminal IP address, gateway IP address, sub network mask) provided by the network administrator

The Terminal Serial Number value field is used only when SSL protocol is activated on the terminal.

When all fields are filled with the data approved by the network administrator, click on the Write File button. Then select the root directory of the USB mass storage key. After directory selection, the application creates a configuration file and an address file.

![Figure 10: Build a setting file on a USB mass storage key](image)

**Second step: apply changes to the terminal**

Remove the smoked front window of the MorphoAccess® J Series terminal to give access to the front USB port of the terminal.

Insure that the MorphoAccess® terminal is powered, and then insert the USB Mass Storage key with the configuration key. The terminal executes an internal process which progress is indicated by audible and visible signals.

At the end of the process, two medium-pitched "beeps" indicates that the USB mass storage key can be removed. The terminal is then restarted, to apply the new values.

![Figure 11: Apply setting file to the MorphoAccess® terminal](image)

Now, the terminal is ready to be connected to the network.
Wi-Fi™ Network configuration

Requirements

Wi-Fi™ connection is available under the following mandatory conditions:

• a Morpho Wi-Fi™ USB adapter must be plugged in the rear USB port of the terminal. The installation procedure is described in the MorphoAccess® J Series Installation Guide.

• a MorphoAccess® Wi-Fi™ license must be present in the terminal (as described in Terminal license management section),

• the terminal must be disconnected from any wired network (it means no Ethernet cable plugged) : Wi-Fi™ connection and Ethernet cable connection are mutually exclusive,

After Wi-Fi™ license downloading and Wi-Fi™ USB adapter installation, make sure to reboot the terminal by pressing the reset button (see paragraph Power supply interface for more information on reset button).

NOTE: Both Wi-Fi™ USB adapter and license can be ordered under the reference "MA WI-FI PACK”.

Configuration

The Wi-Fi™ network configuration is described in the chapter 15 of the MorphoAccess® Enrolment station User Guide document.

Wi-Fi™ troubleshooting

If the terminal is configured to use the Wi-Fi™ connection with the Wi-Fi™ USB adapter plugged in and if there is no license present, the MorphoAccess® J Series terminal will display a 1-second red flash and will emit a short-low tone.

To solve this issue, unplug the Wi-Fi™ USB adapter and restart the terminal.

To restart the terminal use the reset button located in front face of the terminal (see Power supply interface section for more information on reset button).

The Wi-Fi™ configuration parameters are described in the MorphoAccess® Parameters Guide document.
Section 4: MorphoAccess® Terminal Configuration
MorphoAccess® terminal configuration parameters

Presentation

The name and the value of the MorphoAccess® terminal parameters (also named "configuration keys") are located into different files composed of several sections, to group configuration keys by affinity.

For example a file named "app.cfg" contains all the parameters defining the main application settings, and the section “bio ctrl” contains the parameters related to the biometric control.

The full name of a configuration key includes the file name and the section name, i.e.: “file name/section name/key name”. Example: “app/bio ctrl/nb attempts”.

Please refer to MorphoAccess® Parameters Guide for the full description of all configuration keys of a MorphoAccess® terminal.

Modifying the value of a parameter

There are two ways to modify the value of a terminal parameter:

• Remotely through an Ethernet or a Wi-Fi™ link, with a client application running on the Host System (such as Morpho Bio Toolbox or MATM applications).

• With a USB mass storage key, which contains a script prepared on a PC (for more information see document MorphoAccess® USB Key encoder User Guide).
Configuring a connected MorphoAccess® terminal

Introduction

A MorphoAccess® terminal can be managed by a PC connected to the terminal, using an application such as MEMS, Morpho Bio Toolbox, MATM, or MorphoEnroll.

The remote operations available are mainly:

- Add a biometric record for a new user,
- Delete a biometric record for a removed user,
- Get Configuration parameter value,
- Modify the value of a configuration parameter
- Get Access control log file content,
- Change contactless card authentication keys
- Firmware upgrade.
- Add a licence

The MorphoAccess® terminal works as a TCP/IP server, which waits for a request from the Host System application, which acts as a TCP/IP client.

![Figure 12: Configuration of a MorphoAccess® terminal by a Host System](image)

The commands supported by the MorphoAccess® terminal are described in the *MorphoAccess® Host System Interface Specification* document.

Date/Time settings

The date/time of the terminal can be initialized by a distant host system using an application such as the "Morpho Bio Toolbox" ("Configuration" tab, "Set date and time" button) described below.
Morpho Bio Toolbox PC application

The Morpho Bio Toolbox application is able to read and modify any MorphoAccess® terminal parameter.

Figure 13: Morpho Bio Toolbox configuration window

Please refer to the User guide available under the “Help” menu of Morpho Bio Toolbox application.

MATM PC application

The MATM application is another application able to read and modify the value of any MorphoAccess® terminal parameter.

In addition to Morpho Bio Toolbox application, the MATM application is able to configure Wi-Fi™ parameters, and to activate SSL protocol.

For more information about this application, please refer to MorphoAccess® Terminal Management User Guide document.

SSL securing

The TCP link used for remote management can be secured using SSL protocol. Please refer to SSL Solution for MorphoAccess® document for further details.
Upgrading the firmware

When required, the MorphoAccess® terminal firmware can be upgraded from a PC, through an IP link (either Ethernet or Wi-Fi™) or using a USB mass storage key.

The last MorphoAccess® terminal firmware can be obtained on a CD/ROM package from the customer service, or can be downloaded from Morpho Website dedicated to biometric terminals:

http://www.biometric-terminals.com/

A login name and a password are required: it can be provided by the customer service:

hotline.biometrics@t.my-technicalsupport.com

Please refer to the MorphoAccess® Firmware Upgrade Guide document for more information about firmware upgrade procedures.
MorphoAccess® Terminal Database management

Introduction

The management of the MorphoAccess® terminal internal biometric database can be done remotely by an Enrolment Station, typically with a PC with MorphoEnroll application, or with MEMS application, or with an application developed with Active_MACI library.

The MEMS architecture allows managing the database of several MorphoAccess® terminals from only one PC enrolment station.

The MorphoEnroll application is dedicated to manage only one MorphoAccess® terminal database.

The management of the database (add/remove users) can be done using a USB mass storage key as described in the MorphoAccess® USB encoder User Guide document.

Adding a user to the database

Adding a user means create a record with the biometric data of two fingers of the user, and a unique identifier.

The MEMS application adds a user to its own database, and then it updates the database of all MorphoAccess® terminals.

The MorphoEnroll application performs user enrollment directly on the MorphoAccess® terminal: this application doesn’t manage any database on the PC.

Removing a user from the database

Removing a user means deleting the user’s record from the database of the MorphoAccess® terminal.

The MEMS application is able to remove a user from a MorphoAccess® terminal without removing it from its own base. But when the user’s record is removed from MEMS database, it is automatically removed from the biometric database of all MorphoAccess® terminals.

The MorphoEnroll deletes directly the user’s record from the MorphoAccess® terminal: this application doesn’t manage any database on the PC.

Database Size

The MorphoAccess® J series terminal can store 500 user records in the local database. This size can be extended to 3000 user’s records by adding a specific license (MA 3K USERS license). For each user, the terminal stores the biometric data of two fingers.
MorphoAccess® terminal license management

Definition of a license

A license unlocks the additional features of the MorphoAccess® terminal.

The MorphoAccess® J Series terminal supports two licenses:

- **MA 3K USERS**,
- **MA_WIFI**.

The feature unlocked by each license is detailed in sections below.

MorphoAccess® terminal MA 3K USERS license

By default, the MorphoAccess® J Series terminal can match a fingerprint against a database with a maximum of 500 user records (two fingerprints per user record).

The MA 3K USERS license extends terminal Access® J Series recognition capabilities to a database with a maximum of 3,000 user records (2 fingerprints per user record).

**Warning:** the database size is not dynamically modified by the license installation. The license allows the creation of database with a higher size, but it doesn’t modify the size of a already created database. The existing database must be deleted, and then recreated with a higher size.

MorphoAccess® terminal MA_WIFI license

The MA_WIFI license enables the Wi-Fi™ network (WLAN) optional feature.

**Warning:** The license alone is not enough, a USB Wi-Fi™ adapter compatible with MorphoAccess® terminals is mandatory.

Adding a license in a MorphoAccess® terminal

To get a license, please contact our [customer service](#).

The license is delivered in a file dedicated to only one MorphoAccess® terminal. Each license file is generated for a unique serial number, and this is checked by the license installation tool, at the beginning of installation process.

An Ethernet connection or a Wi-Fi™ link is mandatory for license installation.

Please refer to document [MorphoAccess® Terminal License Management](#) for more information about license manager tool.

Checking terminal license in a MorphoAccess® terminal

The Licence Manager PC application is able to read the name of the licenses stored in a MorphoAccess® terminal.

An Ethernet connection or a Wi-Fi™ link is mandatory for this operation.
Please refer to document *MorphoAccess® Terminal License Management* for more information.
Section 5: Access Control
Access control presentation

Typical architecture of an access control system

Typical access control system architecture includes:

- one MorphoAccess® terminal per area to protect
- an Enrollment Station dedicated to user enrollment, and database synchronization with all MorphoAccess® terminals (it could be a PC with MEMS application)
- a Central Security Controller: for area access final check, and physical access command (open the door)

![Figure 14: Typical access control system architecture](image)
Typical access control process

1. All allowed user must be enrolled by the enrolment station. It means that the enrolment station creates a record for each allowed user. This record includes the biometric data of two of the user’s fingers.

2. When required, the Enrolment Station adds new user records into each MorphoAccess® terminal, and removes obsolete user records.

3. When a user request the access to the area protected by the MorphoAccess® terminal, the terminal checks user’s access rights using a biometric check.

4. If the result of the local access rights check is successful, a message is send to the Central Security Controller for additional access rights check.

5. At the end of process, the Central Security Controller return a success signal to the MorphoAccess® terminal, and an “open door” command to the door controller.
MorphoAccess® terminal operating modes

Standalone mode or Slave mode

The MorphoAccess® terminal supports two exclusive operating modes:

- The Standalone Mode: the MorphoAccess® terminal manages the access control alone, or with the help of a central access controller.
- The Proxy Mode: the access control application is located in a distant system which drives the MorphoAccess® terminal as a slave device.

The Proxy mode is described in the Section 9 Proxy (or slave) Mode section. The standalone mode is described in section below.

Standalone mode: Identification and/or Authentication

When in standalone mode, the MorphoAccess® terminal supports two main different access control processes:

- The identification process, which starts when the user places his finger on the biometric sensor. This process is described in the Section 6 Access control by identification section.
- The authentication process, which starts with the presentation of a user’s contactless card. Next step is the placement of user’s finger on the biometric sensor. The terminal allows several authentication processes depending on the location of the reference biometric data, and on the level of security required. These processes are described in the Section 7 Access control by authentication section.

The identification and the authentication processes can be activated simultaneously, as described in Section 8: Multi-factor mode section.
How to select the standalone access control process

The chart below describes the different processes available and the related configuration keys.

[Diagram showing access control processes]

Identification and one authentication processes can be activated at the same time, as described in Section 8: Multi-factor mode section.
Access control result

Information for the user

The MorphoAccess® terminal communicates the result to the user, by a local audible and visible signal. These signals are described in the Section 11 Man Machine Interface section.

For example:

• When the access is granted, the terminal emits a green flash and a high pitched note
• When the access is denied, the terminal emits a red flash and a low pitched note

Information for the administrator

The MorphoAccess® terminal creates a record for each access request, in a internal log file. Each record contains the date and the time, the user’s identifier (if available), and the result of the local access control check.

This feature is described in the Access request result log file section.

Integration in an access control system

At the end of the access rights control, the MorphoAccess® terminal is able to:

• Send a message, with data related to the access request, to a distant system which could be a simple storing system, or a Central Security Controller. This feature is described in the Sending the access control result to a distant system section.
• Wait for the answer of a distant system answer before emitting the result signal for the user. This feature is described in the LED IN feature section.
• Activate an internal relay (if the access is granted to the user), as described in Internal Relay activation on Access Granted result section.

The format of the messages (which include the user’s identifier) send to the distant system is described in the MorphoAccess® Remote Messages Specification document.
Access granted

Figure 16: Access control result = access granted

Access denied

Figure 17: Access control result = Access denied
Section 6: Access Control by Identification
Identification mode description

Identification process

The identification process consists in retrieving the identity of an unknown person, by comparison of a personal data with a base which contains the same type of personal data of known persons. At the end of the process, the person is either identified (identity found), or still unknown.

Access control by identification

The Identification process of the MorphoAccess® terminal proceed by comparison of the biometric data of the finger placed on the biometric sensor, with the biometric data of all the fingers stored in the database.

It means that the biometric data of the allowed users must be stored in the internal database before they can request the access on the terminal. The biometric data of allowed users are acquired by an enrolment station, with the same kind of biometric sensor.

The access control by identification process is started when a finger is detected on the biometric sensor.

When the user requests the access, his identity is unknown, and it is the terminal that searches for his identity. The terminal grants the access if a match is found (the user is identified), otherwise the access is denied (the user remains unknown).

Result of the access control request

The result of the access right control is indicated by an audible and visible signal emitted by the MorphoAccess® terminal itself. These signals are described on the Access control result section.

User’s data required in the terminal

This mode requires that all authorized users must be enrolled in the internal database of the terminal. It means that there is one record per authorized user: each user record contains a unique identifier and the biometric data of two different fingers of the user.

The management of the internal database is described in the MorphoAccess® Database management section.
Compatibility with Access Control Systems

When the identification mode is activated, the MorphoAccess® terminal supports the optional features listed below:

- Internal relay activation when the access is granted, as described in Internal Relay activation on Access Granted result section
- External activation of the internal relay, as described in Internal Relay activation by external button section
- Send access control result message to a remote system, as described in Sending the access control result to a distant system section
- Wait for distant system confirmation before granting the access, as described in LED IN feature section

Activation key

The Identification mode is enabled (and disabled) by only configuration key.

<table>
<thead>
<tr>
<th>Activation of identification mode</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>app/bio ctrl/identification = 1</td>
<td>Enabled</td>
</tr>
<tr>
<td>app/bio ctrl/identification = 0</td>
<td>Disabled</td>
</tr>
</tbody>
</table>
User Interface

In this mode, the MorphoAccess® terminal waits for the placement of a finger on the biometric sensor. This state is displayed to the user by a specific signal, as described in Terminal states section.

To request the access, the user places his finger on the biometric sensor: this action starts the identification process.

![Identification mode](image)

*Figure 18: Identification mode*

The biometric data of the finger is captured, and then compared to all the biometric data stored in the local database of the terminal.

- If a match is found, then the user is identified, and if there is no other access right check, the access is granted to the user.
- Otherwise, if no match found, the user remains unknown (the user’s identifier is unavailable), and the access is denied.

The result of the identification process is notified to the user by a specific signal, as described in Terminal states section.

When the identification process is completed, whatever is the result (identified or not identified), the terminal automatically restarts to the initial state: wait for finger placement on the biometric sensor.

When there is no user stored in the database, the identification process is disabled. No user (even an authorized user) is able to grant the access. The terminal notifies this invalid state to the user, by emitting a specific signal, as described in Terminal states section.
Section 7: Access control by Authentication
Authentication process

Introduction

The MorphoAccess® J Series terminal offers an authentication mode designed to work with contactless smart cards used as personal cards.

Then this section relates to only MorphoAccess® terminals equipped with a contactless smartcard reader (see section Scope of the document).

In the whole document the word “card” means “contactless smart card”.

Authentication process

The authentication process consists in verifying the identity provided by a person, by comparison of a personal data with the reference personal data of this person.

It means that at the beginning of the process, the person provides his identity and the authentication process verify it. At the end of the process, the identity is either confirmed (authenticated), or not confirmed (not authenticated).

This mode doesn’t compare the user’s data to the data of several users: it compare the data provided by the user with the reference data provided by the same user during enrollment phase.

Access control by authentication

To provide his identity, the user presents his personal identity card, which contains his identifier. This action starts the authentication process.

![Figure 19: Contactless card presentation starts authentication process](image)

The user’s card must contain the user’s identifier and optionally the biometric data of the user.

The terminal performs the required identity checks using the data read on the user’s card, and if required, data stored in the internal database.

When it is required, the biometric check compares the biometric data of the finger placed on the sensor with the reference biometric data of two fingers of the user, acquired during enrollment process.
If a match is found, the result of the biometric check is positive: user’s identity is confirmed. Otherwise, the result of the biometric check is negative: user’s identity is not confirmed.

The access is granted only to authenticated users (user’s identity confirmed).

Authentication modes can be combined with a local identification in a multi-factor mode, which is described in Section 8 Multi-factor mode section.

Data required on the user’s card

The MorphoAccess® terminal ignores contactless card encrypted with unknown authentication keys. It means that the terminal starts the authentication process if the user’s card is encrypted with the contactless authentication keys stored in the terminal.

The MorphoAccess® terminal rejects user’s cards without the data required by the authentication process selected.

All authentication modes require the presence of the user’s identifier value. The other data and the format of all the data required depends on the authentication mode selected.

All non mandatory data found on the user’s card are ignored.

Please refer to the MorphoAccess® Contactless Card Specification document for more information about contactless smartcard logical structure.

Authentication process options

The MorphoAccess® terminal offers several authentication processes, depending on the user’s reference biometric data location, and the security level required.

The user’s reference biometric data can be located:

- Either on his personal card, as described in Biometric check, biometric data on user’s card section
- Or in a record of the internal database, as described in Biometric check, biometric data in local database

In addition, the biometric check can be disabled as specified in the section listed below:

- Manual bypass of biometric control
- Automatic bypass of biometric control
Manual bypass of biometric control

The default configuration of authentication mode requires a biometric control. But the biometric check can be disabled by the MorphoAccess® terminal administrator. When this is done, the MorphoAccess® terminal:

- doesn’t require the user to place a finger on the biometric sensor
- grant the access without biometric check

According to the authentication process selected, the terminal:

- doesn’t perform any check on the user’s identifier, as described in section No biometric check, no user id check

Automatic bypass of biometric control

The MorphoAccess® terminal offers an authentication mode which depends on the user’s card content.

When the MorphoAccess® terminal detects a user’s card, it searches for a specific data which indicates, if the biometric check is either mandatory or disabled.

This authentication mode is described in section Authentication process specified by User’s card.

Result of access control check

The result of the access control check is signified to the user by local audible and visible signals, as described in Access control result section.

Compatibility with Access Control Systems

When the identification mode is activated, the MorphoAccess® terminal supports the features listed below:

- Internal relay activation when the access is granted, as described in Internal Relay activation on Access Granted result section
- External activation of the internal relay, as described in Internal Relay activation by external button section
- Send access control result message to a remote system, as described in Sending the access control result to a distant system section
- Wait for distant system confirmation before granting the access, as described in LED IN feature section
Selection of user’s contactless card type (MIFARE™ or DESFire™)

Contactless Card type

As MorphoAccess® J-Dual terminals are equipped with a contactless smartcard reader compatible with MIFARE® and DESFire® cards, it is possible to specify the type of card to be supported by the terminal:

- MIFARE® cards only,
- or DESFire® 3DES cards only,
- or DESFire® AES cards only,
- or MIFARE® and DESFire® 3DES cards,
- or MIFARE® and DESFire® AES cards,
- or MIFARE® and DESFire® AES and 3DES cards.

The MorphoAccess® J-Dual terminals are able to read both DESFire® and DESFire® EV1 smartcards.

The AES cipher is only supported on DESFire® EV1 cards.

The 3DES cipher used on DESFire® EV1 cards is the same as the one used on DESFire® cards (i.e. it is the backward compatibility mode, not the new 3DES cipher of the DESFire® EV1 cards).

Configuration key

The type of contactless smartcard enabled is defined by the following specific configuration key:

<table>
<thead>
<tr>
<th>Type of contactless smartcard enabled</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/contactless/enabled profiles = 0</td>
<td>MIFARE® cards only (support binary or TLV format for user’s identifier)</td>
</tr>
<tr>
<td>app/contactless/enabled profiles = 1</td>
<td>DESFire® 3DES cards only (TLV format only)</td>
</tr>
<tr>
<td>app/contactless/enabled profiles = 2</td>
<td>MIFARE® cards only (TLV format only)</td>
</tr>
<tr>
<td>app/contactless/enabled profiles = 3</td>
<td>MIFARE® and DESFire® 3DES cards (TLV format only)</td>
</tr>
<tr>
<td>app/contactless/enabled profiles = 8</td>
<td>DESFire® AES cards only (TLV format only)</td>
</tr>
<tr>
<td>app/contactless/enabled profiles = 9</td>
<td>DESFire® AES and 3DES cards (TLV format only)</td>
</tr>
<tr>
<td>app/contactless/enabled profiles = 10</td>
<td>MIFARE® and DESFire® cards (TLV format only)</td>
</tr>
<tr>
<td>app/contactless/enabled profiles = 11</td>
<td>MIFARE® and DESFire® AES and 3DES cards (TLV format only)</td>
</tr>
</tbody>
</table>
**Compatibility with Authentication modes**

Using a binary value read on the card as user’s identifier is allowed only with MIFARE™ smart card, and when the “app/contactless/enabled profiles” configuration key is set to 0 (zero).

All other values of this configuration keys requires TLV formatted data, as described in the [MorphoAccess® Contactless Card Specification](#) document.
Biometric check, biometric data on user’s card

Description

In this mode, each user's card contains an identifier and the biometric data of two different fingers of the user. The terminal compares the biometric data of the finger placed on the biometric sensor, with the biometric data found on the user’s card. If a match is found, the access is granted, otherwise the access is denied.

This authentication mode doesn’t use the internal database of the terminal.

If required, the biometric check can be disabled, as described in the No biometric check, no user id check section.

User’s data required in the terminal

This authentication mode doesn’t use the internal database of the MorphoAccess® terminal. None user’s personal data is required in the terminal.

User’s data required on the user’s card

To be compatible with this authentication mode, the user’s card must contain:

• the user’s identifier (User ID)
• the biometric data of two reference fingers of the user.

All other data are ignored.

The data on the card must comply with the TLV format, as described in the MorphoAccess® Contactless Card Specification document.

Activation key

This mode is activated by only one configuration key.

<table>
<thead>
<tr>
<th>Authentication mode with biometric data check and biometric data stored on user’s card.</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>app/bio ctrl/authent PK contactless = 1</td>
<td>Enabled</td>
</tr>
<tr>
<td>app/bio ctrl/authent PK contactless = 0</td>
<td>Disabled</td>
</tr>
</tbody>
</table>
User interface

The authentication process starts when the user presents his contactless card in front of the terminal. If the terminal found the required data on the user’s card, then the user is invited to place his finger on the biometric sensor, for biometric authentication.

![Authentication with user's fingerprints on contactless card](image)

Figure 20: Authentication with user's fingerprints on contactless card

The terminal compares the biometric data of the finger placed on the sensor, with the reference biometric data of the two reference fingers read on user’s card.

The authentication process is successful (identity confirmed) if the captured finger data matches with one of the two references finger data. Otherwise, if no match is found, the authentication process fails (identity not confirmed).

The result of the authentication process is notified to the user by a specific signal, as described in Terminal states section.

When the authentication process is completed, whatever is the result (identity confirmed or not), the terminal automatically restarts to the initial state: wait for another user’s card presentation.
Biometric check, biometric data in local database

Description

In this mode, each user's card contains only an identifier. The biometric data of two different fingers of the user are stored in the internal database, with the same user's identifier as the one on the user's card.

The terminal compares the biometric data of the finger placed on the biometric sensor, with the user’s biometric data found in the database. If a match is found, the access is granted, otherwise (no match found) the access is denied.

User’s data required in the terminal

This authentication mode requires the creation of a record for each allowed user. Each record contains:

- The same user’s identifier value as the one stored on user’s card
- The biometric data of two user’s fingers

If the user’s identifier read on the user’s card, is not found in the database, then the access denied.

The size and the management of the MorphoAccess® terminal internal database is described in MorphoAccess® Database management section.

User’s data required on card

The only data required on the user’s card is the user’s identifier. All other data is ignored.

The terminal is able to read the user’s identifier either stored according to TLV format or to be read directly at a given offset on the card (binary format).

The TLV format is described in the MorphoAccess® Contactless Card Specification document.

Activation key

The configuration key below is used to activate the authentication mode with user’s reference biometric data stored in database.

<table>
<thead>
<tr>
<th>Authentication with biometric data stored in the database</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>app/bio ctrl/authent ID contactless = 0</td>
<td>Disabled</td>
</tr>
<tr>
<td>app/bio ctrl/authent ID contactless = 1</td>
<td>Enabled</td>
</tr>
</tbody>
</table>
User Interface

The authentication process starts when the user presents his contactless card in front of the terminal. If the terminal found the required data on the user’s card (the user’s identifier), it search for the user’s record, in the internal database. Then the user is invited to place his finger on the biometric sensor, for biometric authentication.

![Authentication with biometric check and database](image)

Figure 21: Authentication with biometric check and database

The authentication process is successful (identity confirmed) if the captured finger data matches with one of the two references finger data. Otherwise (no match found) the authentication process fails (identity not confirmed).

The result of the authentication process is notified to the user by a specific signal, as described in Terminal states section.

When the authentication process is completed, whatever is the result (identity confirmed or not), the terminal automatically restarts to the initial state: wait for another user’s card presentation.

When there is no user stored in the database, this authentication process is disabled. No user (even an authorized user) is able to grant the access by this way. The terminal notifies this invalid state to the user, by emitting a specific signal, as described in Terminal states section.
No biometric check, no user id check

Description

This authentication mode is the version of the “Biometric check, biometric data on user’s card” authentication mode with biometric check disabled.

The terminal searched only for the user’s identifier on the user’s card. No other check is performed: the user’s identifier is not searched in the local database, and there is no biometric check.

The MorphoAccess® terminal acts as a simple contactless card reader.

The access is granted only if the user’s card is encrypted with the authentication keys stored in the terminal, and if the terminal is able to read a user’s identifier. Otherwise, the card is ignored and the access denied.

User’s data required in the terminal

In this authentication mode, the internal database of the MorphoAccess® terminal is not used.

User’s data required on the user’s card

The user’s identifier (User ID) is the only one data required on the user’s record, all other data are ignored.

The terminal is able to read the user’s identifier either stored according to TLV format or to be read directly at a given offset on the card (binary format).

The TLV format is described in the MorphoAccess® Contactless Card Specification documents.

The MorphoAccess® terminal doesn’t perform any check on the value of the user’s identifier.

Activation keys

This mode is activated with two configuration keys.

<table>
<thead>
<tr>
<th>Authentication process without biometric check and without User ID search in database</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>app/bio ctrl/authent PK contactless = 1</td>
<td>Enabled</td>
</tr>
<tr>
<td>app/bio ctrl/bypass authentication = 1</td>
<td>Enabled</td>
</tr>
</tbody>
</table>
User Interface

The authentication process starts when the user presents his contactless card in front of the terminal.

![User Interface Diagram](image)

**Figure 22: Authentication without biometric check, and without User ID check**

The authentication process succeeds if the user’s identifier is found. Otherwise, the authentication process fails.

The result of the authentication process is notified to the user by a specific signal, as described in [Terminal states](#) section.

When the authentication process is completed, whatever is the result (identity confirmed or not), the terminal automatically restarts to the initial state: wait for another user’s card presentation.
No biometric check, but User ID check

Description

This authentication mode is the version of the “Biometric check, biometric data in local database” authentication mode, when biometric check is disabled.

The user’s identifier is the only data read on user’s card. The MorphoAccess® terminal checks if the user’s identifier exists in the database.

The access is granted if the user’s identifier read on the user’s card is found in the internal database. Otherwise (user’s identifier not found in the database), the access is denied.

User’s data required in the terminal

This mode requires a local database, and a record must be created for each allowed user. Each record contains:

- The same identifier as the one on the user’s card
- The reference biometric data of two fingers of the user.

If the terminal doesn’t found a record with the user’s identifier read on the card, the access is denied.

The size and the management of the MorphoAccess® terminal internal database is described in MorphoAccess® Terminal Database management section.

User’s data required on the user’s card

The only data required on the user’s card is the user’s identifier.

The terminal is able to read the user’s identifier either stored according to TLV format or to be read directly at a given offset on the card (binary format).

All other data found on the card is ignored.

Contactless smartcard logical structure is described in MorphoAccess® Contactless Card Specification document.

Activation keys

This function requires several configuration keys.

<table>
<thead>
<tr>
<th>Authentication process without biometric check, but User ID is searched in database</th>
<th>Enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/bio ctrl/authent ID contactless = 1</td>
<td></td>
</tr>
<tr>
<td>app/bio ctrl/bypass authentication = 1</td>
<td></td>
</tr>
</tbody>
</table>
User Interface

The authentication process starts when the user presents his contactless card in front of the terminal.

![User Interface Image](image)

Figure 23: Authentication without biometric check, and without User ID check

The user’s identifier is read on the user’s card and searched in the local database. The authentication process succeeds if the user’s identifier is found in the local database. Otherwise, the authentication process fails.

The result of the authentication process is notified to the user by a specific signal, as described in Terminal states section.

Once the authentication process is completed, the terminal automatically loops back and waits for another user’s card presentation.
Authentication process specified by User’s card

Description

When this mode is enabled, the access rights check to perform is specified by a dedicated data on user’s card. It means that the same terminal can execute a different process according to a data found on the user’s card:

- Either the biometric check is performed with the reference biometric data found on user’s card
- Or the biometric check is disabled, and only the presence of the user’s identifier on the user’s card is checked

A card which disables the biometric control is useful when the biometric data capture is not required (for a short period visitor for example), or impossible (physically or legally). This kind of cards can be realized without user’s presence and the same card used for different visitors.

The internal database of the MorphoAccess® terminal is not used.

User’s data required in the terminal

This authentication mode doesn’t use the internal database. There is no personal data stored in the terminal.

User’s data required on the user’s card

To be compatible with this mode, the user’s card must contain the user’s identifier and the process selector.

If the biometric check is requested, the biometric data of two fingers of the user must be present on the user’s card.

All other data are ignored.

The required data must be stored according to TLV format.

Contactless smartcard logical structure is described in *MorphoAccess® Contactless Card Specification* document.

Activation key

This mode is activated and deactivated by only one configuration key.

<table>
<thead>
<tr>
<th>Authentication process defined by user’s contactless card</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>app/bio ctrl/authent card mode = 1</td>
<td>Enabled</td>
</tr>
<tr>
<td>app/bio ctrl/authent card mode = 0</td>
<td>Disabled</td>
</tr>
</tbody>
</table>
User Interface

Start

The authentication process starts when the user presents his contactless card in front of the MorphoAccess® terminal.

The terminal searches on the user’s card, for the data that indicates if the biometric check is mandatory or disabled. If this data is found, the terminal executes the required process.

![Authentication process specified by user's card](image)

**Figure 24: Authentication process specified by user's card**

**Biometric check mandatory**

The terminal requires the user to place a finger on the biometric sensor. Then it executes a biometric comparison of the finger placed on the sensor and the reference biometric data read on user’s card.

The process is identical to the one described in [Biometric check, biometric data on user’s card](#).

**Biometric check disabled**

The result of the authentication process is positive (identity confirmed), if the user’s identifier is found on the user’s card.

The terminal doesn’t require the user to place a finger on the biometric sensor, and doesn’t perform any biometric check.

The process executed in identical to the one described in [No biometric check, no user id check](#).
Allowed format for User’s identifier

**TLV structured data**

The user’s identifier is stored in ASCII within a TLV structure.

<table>
<thead>
<tr>
<th>User’s identifier stored in TLV format</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>app/contactless/data format = 0</td>
<td>TLV structure</td>
</tr>
<tr>
<td>app/contactless/data length=0.0</td>
<td>Automatic size</td>
</tr>
<tr>
<td>app/contactless/data offset= 0.0</td>
<td>Automatic offset</td>
</tr>
</tbody>
</table>

The data written on user’s card by MEMS application, and by MorphoAccess® 500 Series terminals enrolment embedded application, are TLV formatted.

The contactless smartcard logical structure is described in a dedicated document: *MorphoAccess® Contactless Card Specification*. 
ISO14443 type A UID

Description

The MorphoAccess® terminal is able to use the ISO 14443 type A Card UID, as user’s identifier.
This Card UID is available from any MIFARE™ cards and from any DESFire™ cards.
The Card UID can be read either in most significant byte first (MSB) order, or in less significant byte (LSB) order.

Card type compatibility

This format can be only used only with the “MIFARE™ only default mode”.

<table>
<thead>
<tr>
<th>Type of contactless smartcard enabled</th>
<th>MIFARE™ only (support binary user’s identifier)</th>
</tr>
</thead>
</table>

When the key value is 0, the terminal is able to get the card UID of MIFARE™ cards and DESFire™ cards.

Configuration keys

A configuration key specifies on which kind of identifier the access rights are assigned. To use Card UID, the CARDDATA tag must be removed, and the CARDSN:STD or the CARDSN:REV must be added.

<table>
<thead>
<tr>
<th>app/ bio ctrl/AC_ID</th>
<th>TLV structure: must be removed</th>
</tr>
</thead>
<tbody>
<tr>
<td>CARDDATA</td>
<td>ISO14443 type A UID, MSB order. The card UID 0xFEA7B152 value gives a user’s identifier equal to 4272402770</td>
</tr>
<tr>
<td>CARDSN:STD</td>
<td>ISO14443 type A UID, LSB order. The card UID 0xFEA7B152 value gives a user’s identifier equal to 1387374590</td>
</tr>
</tbody>
</table>

Another configuration key specifies which kind of user’s identifier starts the access control process.

Data use for access control request

| app/contactless/ event on = 1 | ISO 14443 type A Card UID (Unique) |
Section 7: Access control by Authentication

| IDentifier |  |
Binary data

*Description*

The MorphoAccess® terminal is able to use as user’s identified, a binary value to read on specific location on user’s card.

This binary value could be the serial number of the card, as explained in the *Example: MIFARE™ card Serial Number used as user’s identifier* section.

The MorphoAccess® terminal is able to read a binary value which is not aligned on complete bytes. This ability is useful to extract the user’s identifier from a Wiegand frame written on the user’s card. A sample is described in *Example: 32 bits user’s identifier within a 37-bits Wiegand frame* section.

No TLV structure is required on user’s card: the MorphoAccess® terminal is able to use user’s cards written by other systems.

*Card type compatibility*

This format can be only used only with the “MIFARE™ only default mode”.

<table>
<thead>
<tr>
<th>Type of contactless smartcard enabled</th>
<th>MIFARE™ only (support binary user’s identifier)</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/contactless/enabled profiles = 0</td>
<td></td>
</tr>
</tbody>
</table>

*Configuration keys*

The binary data to read is data defined by:

- The offset of the first block which contains the data
- The offset of the first byte/bit of the data, within the sector (15 bytes maximum). The terminal is able to read a user’s identifier which offset is different from a multiple of 8 bits.
- The length (in bytes and bits) of the data (8 bytes maximum). The terminal is able to read a user’s identifier which length is different from a multiple of 8 bits.
- The read direction (MSB or LSB)

<table>
<thead>
<tr>
<th>User’s identifier stored in ASCII format</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/contactless/dataformat = 1 Binary format</td>
</tr>
<tr>
<td>app/contactless/B [1-215] First block to read on card</td>
</tr>
<tr>
<td>app/contactless/data length [number of bytes],[additional bits] User ID length in bytes and additional bits (8 bytes maximum)</td>
</tr>
<tr>
<td>app/contactless/data offset [number of Location of first byte/bit of the user’s</td>
</tr>
<tr>
<td>bytes</td>
</tr>
<tr>
<td>---</td>
</tr>
<tr>
<td>app/contactless/data type</td>
</tr>
</tbody>
</table>

**Example: MIFARE™ card Serial Number used as user’s identifier**

In this sample the terminal read the first four byte, in MSB direction, of the first sector of the MIFARE™ card which contains the serial number of the card.

If bytes to read are F4 E1 65 34, then the user identifier value is "4108412212" (ASCII).

| app/contactless/data format= 1 | Binary format |
| app/contactless/data type= 0.1 | Binary MSB format |
| app/contactless/data length = 4.0 | Size = 4 bytes, no additional bit |
| app/contactless/data offset= 0.0 | First byte of the block |
| app/contactless/B= 1 | First block of the card |

**Example: 32 bits user’s identifier within a 37-bits Wiegand frame**

The user’s card contains, at the first block of sector 15 a full 37 bits Wiegand frame (which includes start and stop bits, the site code of the sender, and user’s identifier).

| Sector 15 |
|---|---|
| Byte 0 | Byte 4 |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 30 | 31 | 32 | 33 | 34 | 35 | 36 | 37 | 38 | 39 |
| P | Site | 32 bits ID ... | ... | ID | P |

**Figure 25 : Sample of user’s identifier which is included in a Wiegand frame**

The 32 bits identifier begins at bit four. It is located after the start bit (bit0) and the site code (bit1-2-3). The first block of sector #15 is block #46.

<p>| Acquisition of a 32 bits user’s identifier inside a 37 bits Wiegand frame. |
|---|---|
| app/contactless/data format= 1 | Binary format |
| app/contactless/data type= 0.1 | Binary identifier, MSB format |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/contactless/data length = 4.0</td>
<td>Size = 4 bytes</td>
</tr>
<tr>
<td>app/contactless/data offset = 0.4</td>
<td>User’s identifier begins at bit 4 of the first byte of the block specified below</td>
</tr>
<tr>
<td>app/contactless/B = 46</td>
<td>Read at block #46 (first block of sector #15)</td>
</tr>
</tbody>
</table>

It is possible to configure the MorphoAccess® terminal to add automatically the start and stop bits to the Wiegand output frame, if the user’s identifier must be send to a distant system using Wiegand protocol.
Section 8: Multi-factor mode
Multi-factor mode

Description

When the identification mode and one of the contactless card authentication modes are activated, then the terminal is in “multi-factor” mode.

User Interface

It means that the user is allowed to choose the access right control to be processed by the terminal:

• If the user places his finger first on the sensor, then it is identification process which is executed.
• If the user presents his contactless card first, then it is authentication process which is executed.

Figure 26: Multi-factor mode (identification and authentication)

When there is no database, the identification mode is disabled, but the authentication mode is still available.

User’s data required in the terminal

The requirements of the Identification mode and the requirements of the selected authentication mode apply to the multi-factor modes.

User’s data required on the user’s card

The items required on the user’s card depend on the authentication mode(s) activated. Please refer to the appropriate section for further details.
Activation keys

This mode is activated by enabling identification mode, and one of the authentication modes with contactless card.

<table>
<thead>
<tr>
<th>Activation of multi-factor mode</th>

</tr>
</tbody>
</table>
Section 9: Proxy (or slave) Mode
Description

Scope

The Proxy mode is an operating mode where the access control main application is located in a distant system. This is not a standalone mode like Identification and Authentication modes.

It means that the terminal becomes a slave of the host system application. The access control application is running on the host system and used MorphoAccess® terminal high level functions:

- Identification function
- Authentication function
- Read data on a contactless card
- Access control result signal command

The MorphoAccess® J Series terminal is driven through an Ethernet (or Wi-Fi™) link using TCP or SSL protocol.

The MorphoAccess® terminal acts as a server: it is either waiting for a command or executing a command.

The commands allowed by the MorphoAccess® terminal are described in the MorphoAccess® Host System Interface Specification document.

For further details about SSL on the MorphoAccess® terminal, please refer to the SSL Solution for MorphoAccess® documentation.
Local signals

When the terminal is waiting for a command from the distant system, there is none local signal: the status LED is off, the sensor backlight is off, the buzzer is off.

But when a command is in progress the terminal emits the signals related to the function. It is the same signals as the standalone modes.

It means, for example, that:

- When the Identify command is in progress, the terminal displays the same signals as the standalone Identification mode.
- When the terminal receives the “access granted” command from the distant system, it emits the “access granted” signal as described in the Access control result section.

The local signals are described in the Section 12 MorphoAccess® J Series terminal sound and light Interface section.

Proxy mode use sample

The sample below described a typical exchange between the terminal and the distant system for a basic access control by identification driven by the distant system.

![Proxy mode use sample](image)

Figure 28: PROXY sample with a remote Identification process
Proxy mode activation

The proxy mode is automatically enabled when the identification mode and all authentication modes are disabled.

<table>
<thead>
<tr>

</tr>
<tr>
<td>app/bio ctrl/authent ID contactless = 0</td>
</tr>
</tbody>
</table>
Section 10: MorphoAccess® Terminal Customization
Number of biometric check attempts

Description

In order to reduce the False Rejection Rate, the terminal allows the user to place again his finger on the sensor for a 2nd try, when the initial biometric check fails. This 2nd try is allowed by default, but can be disabled.

The 2nd try allows the user to upgrade the finger placement, or to place another finger. In addition, and also to reduce the FRR, during this 2nd try, the terminal executes a more powerful biometric check (which is also little bit slower).

Configuration key

By default, the two attempts mode is activated, but can be disabled.

<table>
<thead>
<tr>
<th>Configuration key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/bio ctrl/nb attempts = 1</td>
<td>Only one, no retry allowed</td>
</tr>
<tr>
<td>app/bio ctrl/nb attempts = 2</td>
<td>Two, one 2nd try is allowed (default)</td>
</tr>
</tbody>
</table>

Identification mode

If the finger of the user is not recognized, he has 5 seconds to place again one of his fingers on the sensor. If a finger is placed on the sensor after this delay, then the terminal process it as a new access request.

The value of this delay is defined by a dedicated configuration key.

<table>
<thead>
<tr>
<th>Identification timeout</th>
<th>5 (1-60)</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/bio ctrl/identification timeout</td>
<td></td>
</tr>
</tbody>
</table>

Authentication mode

In authentication mode, if the user place on a sensor a finger which is not recognized, then the terminal request him to replace his finger without presenting his card again. The result is sent only after this second attempt.

The wait delay for a finger on the sensor is specified by one configuration key.

<table>
<thead>
<tr>
<th>Authentication timeout (seconds)</th>
<th>10 (1-60)</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/bio ctrl/authent timeout</td>
<td></td>
</tr>
</tbody>
</table>
Setting up matching threshold

Description

The performances of a biometric system are mainly characterized by two values:

- The False Reject Ratio (FRR) : number of wrongly rejected allowed users, divided by the number of access requests
- The False Acceptance Ratio (FAR) : number of wrongly admitted not allowed users, divided by the number of access requests

Both ratio values are linked. Different trade-offs are possible between FRR and FAR depending on the security level targeted. When convenience is the most important factor, the FAR must be low and conversely if security is more important, then the FAR has to be minimized.

Different tunings are proposed in the MorphoAccess® terminal depending on the security level targeted by the access control system.

Configuration key

The False Acceptance Ratio is tuned indirectly by a configuration key: the highest is the configuration key value; the lower is the FRR value.

<table>
<thead>
<tr>
<th>Setting up the matching threshold</th>
<th>3 (1-10)</th>
</tr>
</thead>
</table>
Matching threshold values are detailed in the table below:

<table>
<thead>
<tr>
<th>Value</th>
<th>FAR value</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Lowest threshold value: the number of false rejects is very low, but the number of false acceptances is too high for a secure usage. It is strongly advised to don’t use this value, because the terminal becomes too tolerant.</td>
</tr>
<tr>
<td>1</td>
<td>FAR &lt; 1 %</td>
</tr>
<tr>
<td>2</td>
<td>FAR &lt; 0.5 %</td>
</tr>
<tr>
<td>3</td>
<td>FAR &lt; 0.1 % <strong>Recommended value for physical access control application</strong></td>
</tr>
<tr>
<td>4</td>
<td>FAR &lt; 0.05 %</td>
</tr>
<tr>
<td>5</td>
<td>FAR &lt; 0.01 % <strong>Recommended value for logical access control application</strong></td>
</tr>
<tr>
<td>6</td>
<td>FAR &lt; 0.001 %</td>
</tr>
<tr>
<td>7</td>
<td>FAR &lt; 0.0001 %</td>
</tr>
<tr>
<td>8</td>
<td>FAR &lt; 0.00001 %</td>
</tr>
<tr>
<td>9</td>
<td>FAR &lt; 0.0000001 %</td>
</tr>
<tr>
<td>10</td>
<td>Highest threshold value: the number of false acceptance is very low, but the number of false rejections is too high for the comfort of users. It is strongly advised to don’t use this value, because the terminal becomes too restrictive.</td>
</tr>
</tbody>
</table>
Anti-tamper and anti-pulling switches

Description

The MorphoAccess® J Series terminal is able to detect two kinds of unusual events:
- the front glass is removed, by monitoring anti-tamper switches
- the terminal is removed from the wall, by monitoring the anti-pulling switches

When one of those events is detected, the MorphoAccess® J Series terminal acts as required by the related configuration key (see section below):
- Ignore the event (default) : useful during normal maintenance operations
- Send an alarm message to a distant system through the channel already used by the access control result messages (see Sending the access control result to a distant system section).
- Emits a local audible and visual signal (see Terminal states section)

The format of the alarm message is described in the MorphoAccess® Remote Messages Specification document.
Please refer to the *MorphoAccess® J Series Installation Guide* for more information about the anti-tamper and the anti-pulling switches.

### Configuration keys

The action(s) to be performed by the MorphoAccess® terminal is defined by a unique dedicated configuration key.

<table>
<thead>
<tr>
<th>Tamper alarm level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/tamper alarm/level = 0</td>
<td><strong>Disabled</strong>: Anti-pulling and anti-tamper switches are ignored (default)</td>
</tr>
<tr>
<td>app/tamper alarm/level = 1</td>
<td><strong>Silent message only</strong>: an alarm message is sent to a distant system.</td>
</tr>
<tr>
<td>app/tamper alarm/level = 2</td>
<td><strong>Silent message and local alarm signal</strong>: in addition to previous level (1), the terminal buzzer emits an audible and visible alarm signal</td>
</tr>
</tbody>
</table>

The alarm message is sent through the same channel as the “access control result” message. Then, if there is no channel defined for the result message, the alarm message is not sent. Please refer to [Sending the access control result to a distant system](#) section.

In addition if the alarm message is to be sent through the serial port using Wiegand or DataClock protocol, it is mandatory to:

- Enable the sending of error messages.
- Change the error code of the message is default value cannot be used

<table>
<thead>
<tr>
<th>Allows the sending of error messages (DataClock/Wiegand protocol)</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/failure ID/enabled=1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Anti-pulling or anti-tamper alarm message identifier (Wiegand or DataClock)</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/failure ID/alarm ID</td>
</tr>
</tbody>
</table>
Example 1: send alarm message in Wiegand, and output local alarm signal

In case of anti-tamper or anti-pulling detection, the terminal must:

- Send an alarm message to a distant system, using Wiegand protocol. The identifier (error code) of the alarm message is 62221.
- Emit a local alarm signal.

<table>
<thead>
<tr>
<th>Send an alarm message in UDP quietly in case of intrusion detection</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/tamper alarm/level = 2</td>
</tr>
<tr>
<td>app/failure ID/alarm ID = 62221</td>
</tr>
<tr>
<td>app/failure ID/enabled = 1</td>
</tr>
<tr>
<td>app/send ID wiegand/enabled = 1</td>
</tr>
</tbody>
</table>

Example 2: send an alarm message in UDP (no local alarm signal).

In case of anti-tamper or anti-pulling detection, the terminal should send an alarm message to a distant system, through Ethernet (or Wi-Fi™), using UDP protocol. No local alarm signal is required.

<table>
<thead>
<tr>
<th>Send an alarm message in UDP in case of anti-pulling or anti-tamper detection</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/tamper alarm/level = 1</td>
</tr>
<tr>
<td>app/send ID UDP/enabled = 1</td>
</tr>
</tbody>
</table>
Section 11 Compatibility with an Access Control System
Internal Relay activation on Access Granted result

Description

If the result of the access rights check is successful, the internal relay may be optionally activated, for example, to directly trigger a door switch.

The duration of the activation of the internal relay can be modified by a specific configuration key.

Access control installation using internal relay offers a lower security level, than an installation with a central access controller which is the only one allowed opening the door.

![Diagram of internal relay activation](image)

Figure 31: MorphoAccess® terminal internal relay

Activation key

A configuration key enables internal relay activation on access granted.

<table>
<thead>
<tr>
<th>Relay activation when access is granted</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/relay(enabled = 0)</td>
</tr>
<tr>
<td>app/relay(enabled = 1)</td>
</tr>
</tbody>
</table>

Configuration keys

The relay aperture time can be defined by a specific configuration key (300 means 3 seconds).

<table>
<thead>
<tr>
<th>Relay aperture time in 10 ms</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/relay/aperture time in 10 ms</td>
</tr>
</tbody>
</table>

The default state of the relay can also be defined.
## Relay default state

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/relay/relay default state = 0</td>
<td>Open (default)</td>
</tr>
<tr>
<td>app/relay/relay default state = 1</td>
<td>Close</td>
</tr>
</tbody>
</table>
Internal Relay activation by external button

Description

This feature enables to activate the internal relay of the MorphoAccess® terminal using the LED1 signal input, in addition to normal activation on access granted result. It means either a successful recognition or a signal on LED1 activate the internal relay.

A typical application of this feature is to open the door from inside an area protected by a MorphoAccess® terminal (as described in figure below).

- To enter in the building the user must be successfully recognized by the MorphoAccess® terminal
- A simple push-button connected to LED1 between LED1 and GND wires of the MorphoAccess® terminal will trigger the door to leave the building.

![Diagram](attachment:image)

**Figure 32**: Activation of internal relay by an external button (sample)

Activation key

A specific configuration key enables this feature.

<table>
<thead>
<tr>
<th>MorphoAccess® relay is controlled by LED1 input</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/relay/external control by LED1 = 0</td>
</tr>
<tr>
<td>Disabled (default)</td>
</tr>
<tr>
<td>app/relay/external control by LED1 =1</td>
</tr>
<tr>
<td>Enabled</td>
</tr>
</tbody>
</table>
Access request result log file

Description

When enabled, the terminal creates a record for each access request in a local log file. Each record includes:

- the date and the time of record creation (when access control result is known),
- the user’s identifier (if available)
- the access control process executed (Identification, Authentication with biometric check, ..)
- the result of the access control (granted or denied, and if denied for which reason),
- And other data used for statistical reasons

The format of a log record is described in the MorphoAccess® Host System Interface Specification document.

Log File management

Three commands are available for log file management:

- A command which return the current status of the log feature (enabled/disabled, number of records)
- A command which returns the content of the log file
- A command that delete the log file

For more information about these commands, refer to the MorphoAccess® Host System Interface Specification document.

Log File size

The capacity of the internal log file is customizable up to 65,000 records (8,000 as default value).

When the log file is full, the terminal automatically stops the addition of new records, but new access requests are allowed.

If requested by the specific configuration keys, the terminal can sent a “log file full” warning message to a distant system.

The format of the “Log file full warning” message is described in the MorphoAccess® Remote Messages Specification document.
Activation key

The creation of a record for each access request is enabled (and disabled), by only one configuration key.

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/log file/enabled = 1</td>
<td>Enabled</td>
</tr>
<tr>
<td>app/log file/enabled = 0</td>
<td>Disabled</td>
</tr>
</tbody>
</table>
Sending the access control result to a distant system

Presentation

After access control rights check, the MorphoAccess® terminal can send a message which contains the result of the control, to a distant device (such as a Central Security Controller). The MorphoAccess® terminal is able to use different channels and different protocols, to send this message.

This message can be used, for instance, to log the access request or to perform additional access rights check. It depends on the role of the distant device in the global access control system.

![Diagram](Image)

Figure 33: Sending access control result message to a distant system

Please refer to *MorphoAccess® Remote Messages Specification* for more information about the format and the protocol of the access control result messages.

The LED IN feature enables to expect a positive answer from the distant system before granting the access.

Available ports and protocols

The MorphoAccess® J Series terminal is able to send the access control result messages to a distant system, using the following ports and protocols:

- serial port: Wiegand or DataClock, or RS485
- Ethernet link or Wi-Fi™ link: TCP or UDP or SSL

This is detailed in the next sections.

Serial port (output only)

**Protocol selection**

There is only one serial port, and then only one protocol can be used. It must be one of these protocols: Wiegand or DataClock or RS485.
**Wiegand protocol**

The Wiegand frame includes only the user identifier (which must be a numeric value). By default, the access control result message is sent only when the user is identified or authenticated.

But as an option this access control result message can be sent when the access is denied, but with a numeric error code instead of the user identifier value.

The sending of the message through the serial port, using DataClock protocol is conditioned only one configuration keys.

<table>
<thead>
<tr>
<th>Send access control result message using Wiegand protocol on serial output port</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/send ID wiegand/enabled = 1</td>
</tr>
<tr>
<td>app/send ID wiegand/enabled = 0</td>
</tr>
</tbody>
</table>

The format of the Wiegand frame is defined by several configuration keys.

**DataClock protocol**

Same comment as for Wiegand protocol.

The sending of the message through the serial port, using DataClock protocol is conditioned only one configuration keys.

<table>
<thead>
<tr>
<th>Send access control result message using DataClock protocol on serial output port</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/send ID dataclock /enabled = 1</td>
</tr>
<tr>
<td>app/send ID dataclock /enabled = 0</td>
</tr>
</tbody>
</table>

**RS485 protocol**

The message is send whatever is the control result, and it contains more information than the Wiegand and the DataClock frames.

The message format (ASCII characters) includes the user identifier, but also the result of the control, the date and time of the access request, and other data.

The sending of the message through the serial port, using RS484 protocol is conditioned to two configuration keys.

<table>
<thead>
<tr>
<th>Send access control result message using RS485 protocol on serial output port</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/send ID serial /enabled = 1</td>
</tr>
<tr>
<td>app/send ID serial /enabled = 0</td>
</tr>
<tr>
<td>app/send ID serial/mode = 485</td>
</tr>
</tbody>
</table>
Ethernet port

Protocol selection

The protocol used to send the message through the Ethernet link, must be only one of these protocols: UDP or TCP or SSL.

UDP protocol

Same comment as for RS485 protocol.

<table>
<thead>
<tr>
<th>Send access control result message using UDP protocol on Ethernet port</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/send ID UDP/enabled = 1</td>
</tr>
<tr>
<td>app/send ID UDP /enabled = 0</td>
</tr>
</tbody>
</table>

TCP protocol

Same comment as for RS485 protocol.

<table>
<thead>
<tr>
<th>Send access control result message using TCP protocol on Ethernet port</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/send ID ethernet /mode = 0</td>
</tr>
<tr>
<td>app/send ID ethernet /mode = 1</td>
</tr>
<tr>
<td>app/send ID ethernet /mode = 2</td>
</tr>
</tbody>
</table>

SSL protocol

For details about SSL protocol, please refer to [SSL Solution for MorphoAccess®](#) document.

Wi-Fi™ channel

Instead of Ethernet connection, the terminal can be connected using a wireless Wi-Fi™ b/g connection. Please refer to [Wi-Fi™ Network configuration](#) section for more information.

The message format and the protocols supported are the same as the Ethernet channel: UDP, or TCP or SSL.

**Warning**: it is not possible for a terminal to be connected through Ethernet and through Wi-Fi™ at the same time.
Note about terminal clock deviation

The message send through IP and RS485 includes the date/time of access control result. The terminal clock has a +/- 4 sec per day typical time deviation at +25°C. At 50°C, the time deviation may be up to -8 sec per day.

For features that requiring time precision (such as SSL protocol or DESFire™ contactless card), the clock of the MorphoAccess® terminal must be synchronized regularly with an external clock (using the appropriated ILV command).
LED IN feature

Description

When this feature is activated, the terminal waits also for a confirmation from a distant system (i.e. a central access controller) before granting the access to the user. When no answer is received, the access is denied, even if the local access rights control is positive.

This feature is to be use in addition to the Sending the access control result to a distant system function.

![LED IN feature](image)

**Figure 34: LED IN feature**

For more information about this interface, please refer to MorphoAccess® J Series Installation Guide.

Process

1. If the user is recognized, then the MorphoAccess® terminal sends a message with the user’s identifier, to a distant system (such as a central access controller).

2. Then the MorphoAccess® terminal starts waiting, during an adjustable duration, for a contact closure between LED1 and GND wires, or between LED2 and GND wires.

3. When the controller receives the message (step 1), it performs its own access control rights checks.

4. According to the result of this check, the access controller closes the contact connected to LED1 and GND wires to grant the access, or close the contact connected to LED2 and GND wires to deny the access. If timeout occurs, while waiting for a low level on LED1 or on LED2 wire, the access is also denied.

5. The MorphoAccess® terminal indicates then the final result of the access control request to the user, and returns to the “wait for access request” state as soon as the LED1 and LED2 wires return in its default state (high level).
The controller supports neither LED1 nor LED2 signals

When the access controller has no relay contact to provide an answer to the MorphoAccess® terminal, then the decision to emit either the “access granted” signal or the “access denied” signal is taken by another way. It is either the MorphoAccess® terminal itself that decide, or it waits for the access controller answer through the local area network (TCP), or on the serial port in (RS422).

It is strongly recommended to disable the LED IN feature, to avoid any interference on MorphoAccess terminal behavior.

The controller supports only LED1 signal

When the access controller has only one relay contact which is dedicated to the “access granted” answer, this one must be connected between the LED1 and GND wires. The LED1 wire is set to the low level by closing the contact between the LED1 and the GND wires), and it means “access granted”.

The MorphoAccess® terminal uses the timeout of the wait for a low level on the on LED1 wire or LED2 wire as ”access denied” answer.

To minimize at most the waiting time of the user, the MorphoAccess® terminal timeout value, must be adjusted to a value a little bit higher than the maximal value of the controller response time.

Warning: if the LED2 wire is connected, it must be constantly maintained in the high state.

The controller supports LED1 and LED2 signals

When the controller supports one relay contact for each of the possible answers then:

- the « access granted » contact must be connected between the LED1 and the GND wires of the terminal
- the « access denied » contact must be connected between the LED2 et the GND wires of the terminal.

The MorphoAccess® terminal considers that:

- The answer of the controller is "access granted", when the controller puts the LED1 wire to the low state (by closing a contact between the LED1 and the GND wires), and leaves the LED 2 wire to the high state.

- The answer of the controller is "access denied", when the controller puts the LED2 wire to the low state (by closing a contact between the LED2 and the GND wires), whatever is the state of the LED 1 wire.

The MorphoAccess® terminal also considers that the answer of the controller is "access denied" in case of time-out while expecting for a closure between LED1 and GND wires, or between LED2 and GND wires.
Section 11 Compatibility with an Access Control System

Activation key

This feature is enabled (and disabled) by only one configuration key.

<table>
<thead>
<tr>
<th>LED IN feature activation</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>app/led IN/enabled = 0</td>
<td>Disabled (default value)</td>
</tr>
<tr>
<td>app/led IN/enabled =1</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

Configuration key

The maximum duration during which the terminal has to wait for an answer from the distant system, is adjustable by one configuration key. The answer from the distant system (i.e. the access controller), is either a low level on LED1 wire or a low level on the LED2 wire.

<table>
<thead>
<tr>
<th>LED IN acknowledge timeout value, in number of 10 ms units</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>app/led IN/controller ack timeout</td>
<td>300 (0 to 268435455)</td>
</tr>
</tbody>
</table>
Time mask feature

Description

The MorphoAccess® terminal provides a feature that enables to deny the access to a normally authorized user, on the base of time of access request.

One typical application is to allow the access during regular working hours, and to deny the access to the same user during closed hours (night, week end).

This feature is compatible with MEMS and MorphoEnroll applications.

Please refer to MorphoAccess® Host Interface Specification document for mode information.

Database

To use this feature the local database must be created with a specific additional user data field.

Each user may have a different time mask from other users.

The time mask is defined by slots of 15 minutes over a week. For each of these 84 slots (of 15 minutes) the access must be specified either granted or denied.

**Warning**: if this field does not exist, activating this feature will forbid the access to all users.

Activation key

The activation of this feature is done using one dedicated configuration key.

<table>
<thead>
<tr>
<th>Enabling the Time mask feature</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>app/modes/time mask = 1</td>
<td>Enabled</td>
</tr>
<tr>
<td>app/modes/time mask = 0</td>
<td>Disabled</td>
</tr>
</tbody>
</table>
Section 12 MorphoAccess® J Series terminal sound and light Interface
Light and sound signals

Light signal description

*Intermittent "Pulse": 1 second OFF and 0.5 second ON*

Sample

| Intermittent blue "Pulse" | ![Intermittent blue "Pulse"] |

*Fast intermittent "Pulse": 0.5 second OFF and 0.5 second ON.*

Sample

| Fast Intermittent yellow "Pulse" | ![Fast Intermittent yellow "Pulse"] |

*Slow intermittent "Pulse": 1 second OFF, 1 second ON*

Sample

| Slow intermittent red "Pulse" | ![Slow intermittent red "Pulse"] |

Audible signal

The volume of the audible signal can be tuned by a specific configuration key

<table>
<thead>
<tr>
<th>Level of the audible signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app/GUI/volume = 0</td>
<td>Volume off</td>
</tr>
<tr>
<td>app/GUI/volume = 1 to 10</td>
<td>Volume tuning (from low to high)</td>
</tr>
</tbody>
</table>
Terminal states

Identification or Authentication: Waiting for a finger on the sensor

The identification mode is activated, and the MorphoAccess® terminal is waiting for the placement of a finger on the biometric sensor.

<table>
<thead>
<tr>
<th>Biometric Sensor backlight</th>
<th>Status LED</th>
<th>Buzzer</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>Not significant</td>
<td>Off</td>
</tr>
</tbody>
</table>

Authentication - waiting for user's contactless card

One of the authentication modes is activated, and the MorphoAccess® terminal is waiting for the presentation of a contactless card.

<table>
<thead>
<tr>
<th>Biometric Sensor backlight</th>
<th>Status LED</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>On, permanent blue</td>
</tr>
<tr>
<td></td>
<td>Slow intermittent yellow</td>
</tr>
<tr>
<td></td>
<td>&quot;Pulse&quot;</td>
</tr>
<tr>
<td></td>
<td>Off</td>
</tr>
</tbody>
</table>

Identification and Authentication - No database or empty database

The selected access control mode requires at least one record in the local database, and there is no database or no record in the database.

<table>
<thead>
<tr>
<th>Biometric Sensor backlight</th>
<th>Status LED</th>
<th>Buzzer</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>Not significant</td>
<td>Off</td>
</tr>
</tbody>
</table>
**Multi-factor mode - waiting for user’s finger or user’s card**

The identification mode, and one of the authentication modes are activated, and the MorphoAccess® terminal is waiting for the placement of a finger on the biometric sensor or for the presentation of a contactless card.

<table>
<thead>
<tr>
<th>Biometric Sensor backlight</th>
<th>ON</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status LED</td>
<td>On, permanent blue</td>
</tr>
<tr>
<td>Buzzer</td>
<td>Off</td>
</tr>
</tbody>
</table>

**Proxy mode - waiting for distant system command**

When the proxy mode is enabled and when the terminal is expecting for a command from the distant system, there is no local signal.

<table>
<thead>
<tr>
<th>Biometric Sensor backlight</th>
<th>Off</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status LED</td>
<td>Off</td>
</tr>
<tr>
<td>Buzzer</td>
<td>Off</td>
</tr>
</tbody>
</table>

**Biometric Sensor start up error**

The terminal fails to start the biometric sensor. If the trouble persists after several terminal start-ups, please contact customer service.

<table>
<thead>
<tr>
<th>Biometric Sensor backlight</th>
<th>OFF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status LED</td>
<td>Slow intermittent red &quot;Pulse&quot;</td>
</tr>
<tr>
<td>Buzzer</td>
<td>Off</td>
</tr>
</tbody>
</table>
Terminal maintenance

A configuration operation is in progress (biometric database update, configuration key value change, access request log file acquisition, etc…). Normal process will be available again as soon as the configuration operation is completed. This signal is displayed during remote management through TCP, and during USB mass storage key processing.

<table>
<thead>
<tr>
<th>Biometric Sensor backlight</th>
<th>Status LED</th>
<th>Buzzer</th>
</tr>
</thead>
<tbody>
<tr>

<td>magenta</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;Pulse&quot;</td>
<td></td>
</tr>
</tbody>
</table>

Maintenance: Biometric Sensor firmware update

This signal is emitted when the biometric Sensor firmware update is in progress. This update occurs only at first start up of the terminal after a terminal firmware update.

<table>
<thead>
<tr>
<th>Biometric Sensor backlight</th>
<th>Status LED</th>
<th>Buzzer</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON/OFF</td>
<td>Slow</td>
<td>Off</td>
</tr>
<tr>
<td>Alternatively</td>
<td>intermittent</td>
<td></td>
</tr>
<tr>
<td></td>
<td>magenta</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;Pulse&quot;</td>
<td></td>
</tr>
</tbody>
</table>

Maintenance: USB mass storage key can be removed

This signal is emitted when the USB Mass Storage key, used to configure the terminal, can be removed from the USB port. The USB Mass Storage key must be removed to complete the maintenance process.

<table>
<thead>
<tr>
<th>Biometric Sensor backlight</th>
<th>Status LED</th>
<th>Buzzer</th>

</tbody>
</table>
Section 13: Compatible Accessories, Software Licenses and Software Applications
Compatible accessories & software licenses

The following items can be ordered directly to Morpho or official distributor, so as to enjoy all the features of your MorphoAccess® J Series terminal:

- Power supply units
- Contactless smartcards: MIFARE™ 1K or 4K ; DESFire™ 2K, 4K or 8K
- MA WI-FI PACK, containing a Wi-Fi™ USB dongle and a Wi-Fi™ license to activate Wi-Fi™ capability on your terminal (see Section 3, paragraph 4)
- J SERIES ADAPTER FOR MA WI-FI PACK, containing one specific mounting spacer plus a short USB cable to facilitate the installation of the Wi-Fi™ dongle (see Section 3, paragraph 4)
- MA 3K USERS License, enabling database upgrade from 500 users capacity (*2 templates) to 3 000 users capacity (*2 templates)
Compatible software applications

MorphoAccess® J Series terminals are fully compatible with:

• MorphoAccess® Enrolment & Management System (MEMS) application
• Morpho Integrator’s Kit (MIK) software development kit
• MorphoEnroll enrolment application
Appendix 1: Finger placement rules
Finger placement recommendations

To ensure a good acquisition quality, please leave the finger on the biometric sensor until the backlight is turned off.
Appendix 2: Bibliography
MorphoAccess® terminal bibliography

How to get latest version of the documents

The documents below are available on a CD/ROM package from our factory, or downloadable on our web site at the address below:

Installation Information

MorphoAccess® J Series Installation Guide, ref. SSE-0000077503

This document describes terminal physical mounting procedure, electrical interfaces and connection procedures

Administrator Information

MorphoAccess® Parameters Guide, ref. SSE-0000062458

This document describes all configuration keys of MorphoAccess® terminal.

SSL Solution for MorphoAccess®, ref. SSE-0000069007

This document describes the SSL Solution deployment for MorphoAccess®, with MATM security plug-in.

MorphoAccess® Terminal License Management, ref. SSE-0000066855

This document details how to manage MorphoAccess® terminal licenses.

MorphoAccess® Enrolment station user guide, ref. SSE-0000035933

The chapter 15 “Configure MorphoAccess® network parameters” describes how to configure the network parameters, for Ethernet and Wi-Fi™, of a MorphoAccess® terminal, with MATM application.

Developer Information

MorphoAccess® Host System Interface Specifications, ref. SSE-0000056821

This document describes the commands supported by the MorphoAccess® terminal, which can be sent by a Host System.
Appendix 2: Bibliography

**MorphoAccess® Remote Messages Specification, ref. SSE-0000062580**

Details how the MorphoAccess® sends the access control result to a distant system.

**MorphoAccess® Contactless Card Specification, ref. SSE-0000062610**

This document describes the format and the localization on contactless card, of the data required by the authentication modes of the MorphoAccess® terminal.

**Support Tools**

**MorphoAccess® Terminal Management User Guide, ref. SSE-0000068869**

This document describes the MATM application, which enables to configure a MorphoAccess® terminal through Ethernet or Wi-Fi™.

**MorphoAccess® USB Network Tool User Guide, ref. SSE-0000043164**

This document describes how to specify the value of the network parameters of a MorphoAccess® terminal, using a USB mass storage key.

**MorphoAccess® USB encoder User Guide, ref. SSE-0000050386**

This document describes how to configure a MorphoAccess® terminal, using a USB mass storage key.

**MorphoAccess® Firmware Upgrade Guide, ref. SSE-0000038184**

This document describes the firmware upgrade process of a MorphoAccess® terminal.
Appendix 3: Support
Troubleshooting

Terminal IP address is unknown or terminal is not reachable

Use USB Network Tool to set a valid network address in your terminal. Refer to USB Network Tool User Guide.

Biometric Sensor backlight is off

Verify that the base contents at least one record. Check that identification mode is enabled.

Terminal returns erratic answers to ping requests

Check the subnet mask. Ask your network administrator for the right value.
Check that each device connected to the network has a different IP address.
